

47N

Epoxy Low-Flow Prepreg

47N is a low-flow epoxy prepreg engineered for bonding multilayer epoxy rigid-flex or attaching heat sinks to multilayer PCBs. An optional reduced lamination temperature protects components already mounted on the PCB.

Features:

- Tetrafunctional modified epoxy resin system with a Tg of 130°C
- Optimized bond to aluminum and copper heat sinks – typical lap shear 1000 PSI
- Cure temperature as low as 300°F (150°C)
- Engineered with discrete flow ranges and fiberglass styles for optimal process flexibility
- Electrical and mechanical properties meeting the requirements of IPC-4101/21, modified to be “Low-Flow”
- RoHS/WEEE compliant
- Cost competitive for high volume commercial applications

Typical Applications:

- Bonding multilayer epoxy rigid-flex
- Attaching heat sinks to multilayer PCBs
- Dielectric insulators

Recommended Process Conditions:

Process inner-layers through develop, etch, and strip using standard industry practices. Bake inner layers in a rack for 60 minutes at 225°F - 250°F (107°C - 121°C) immediately prior to lay-up. Vacuum desiccate the prepreg for 8 - 12 hours prior to lamination.

Lamination Cycle:

- 1) Pre-vacuum for 30 - 45 minutes
- 2) Control the heat rise to 8°F - 12°F (4°C - 6°C) per minute between 150°F and 250°F (65°C and 121°C)
- 3) Lamination Pressure: 150-300 PSI (11-21 Kg/cm²) depending on complexity
- 4) Product temperature at start of cure = 340°F (171°C).
- 5) Cure time at temperature = 60 minutes
- 6) Cool down under pressure at ≤ 10°F/min (6°C/min)

Drill at 350-400 SFM. Undercut bits are recommended for vias 0.023" (0.9cm) and smaller

De-smear using alkaline permanganate or plasma with settings appropriate for epoxy; plasma is preferred for positive etchback

Conventional plating processes are compatible with 47N

Standard profiling parameters may be used; chip breaker style router bits are not recommended

Bake for 1 - 2 hours at 250°F (121°C) prior to solder reflow or HASL
