

Polyimide Low-Flow Prepreg

38N is an improved polyimide low-flow prepreg suitable for bonding multilayer polyimide rigid-flex, attaching heat sinks to polyimide MLBs, or other applications where minimal and uniform resin flow is required.

Features:

- Novel chemistry ensuring faster and more uniform resin cure for minimal and consistent resin flow, preventing excessive flow into clearance/relief areas
- Improved bond strength to Kapton® polyimide of up to 50% compared with conventional polyimide low-flow or no-flow products
- $T_g = 200^\circ\text{C}$ and expansion characteristics typical of polyimide greatly improves PTH reliability
- Curable at temperatures as low as 350°F (177°C)
- Excellent thermal stability
- Improved bond strength to copper and other metals for excellent performance in heat sink bonding applications
- Electrical and mechanical properties meeting the requirements of IPC-4101/42
- Compatible with lead-free processing
- RoHS/WEEE compliant

Typical Applications:

- Bonding multilayer polyimide rigid-flex
 - Finished PCB assemblies requiring excellent thermal stability
 - Dielectric insulators
 - Other applications where minimal and uniform resin flow is required

Recommended Process Conditions:

Because of varying storage conditions, it is recommended that 38N prepreg be dried at 29" (736mm) Hg for 12 to 24 hours.

38N Low-Flow prepreg is very process tolerant. It laminates well with either a cold platen press start or with a hot start. Vacuum or vacuum assist lamination is recommended for the removal of moisture and air. Low-Flow products do not displace air voids as well as standard prepregs, and vacuum will help assure a void-free final product.

Lamination Cycle:

- 1) Vacuum draw down the package for 30 minutes at <29" (736 mm Hg) prior to applying pressure in the press. Maintain the vacuum beyond the set point of the resin, i.e., above 320°F (160°C)
- 2) Use a platen temperature in the range of 370°F - 380°F (188°C - 193°C).
- 3) Control the heat rise to about 8°F - 12°F per minute (4.5°C - 6.5°C) between 210°F and 300°F (100°C and 150°C)
- 4) Use a pressure of 180 to 350 psi (12.6 to 24 kg/sq.cm), depending on panel size and complexity.

Following are recommended pressures relative to panel size to use as starting points:

Panel Size		Pressure	
in.	mm	psi	kg/cm2
12 x 18	305 x 457	250	18
16 x 18	406 x 457	290	20
18 x 24	457 x 610	330	23

Cure time is 90 minutes at temperature.

The subsequent processing should be the same as those normally used for rigid-flex PCBs
