

## Polyimide Nonwoven Aramid

---

85NT is a pure polyimide laminate and prepreg system ( $T_g=250^\circ\text{C}$ ), reinforced with a non-woven aramid substrate. 85NT combines the high-reliability features of polyimide (improved PTH reliability and temperature stability) with the low in-plane (X,Y) expansion and outstanding dimensional stability of the aramid reinforcement.

### Features:

- Low in-plane (X,Y) CTE of 7-9 ppm/ $^\circ\text{C}$  allows attachment of SMT devices with minimal risk of solder joint due to CTE mismatch
- Nonwoven aramid reinforcement provides outstanding dimensional stability and enhanced registration for improved multilayer yields.
- Decomposition temperature of  $426^\circ\text{C}$ , compared with  $407^\circ\text{C}$  for pure polyimide, offering outstanding high-temperature processing stability
- Aramid reinforcement results in PCBs typically 25% lighter in weight than glass-reinforced laminates
- Laser and plasma ablatable for high speed formation of microvias and other features as small as  $25\mu\text{m}$  ( $\mu 0.001''$ )
- Electrical and mechanical properties meeting the requirements of IPC-4101/53
- Compatible with lead-free processing

### Typical Applications:

- Military and commercial avionics, missiles and missile defense, satellites, and other high-reliability SMT applications requiring low in-plane (X,Y) CTE values
  - PCBs that are subjected to high temperatures during processing, such as lead-free soldering, HASL
  - Applications with significant lifetimes with elevated temperature cycling, such as aircraft engine instrumentation, on-engine applications, or industrial sensors

## Recommended Process Conditions:

Process inner-layers through develop, etch, and strip using standard industry practices. Use brown oxide on inner layers. Adjust dwell time in the oxide bath to ensure uniform coating. Bake inner layers in a rack for 60 minutes at 107°C - 121°C (225°F - 250°F) immediately prior to lay-up. Vacuum desiccate the prepreg for 8 - 12 hours prior to lamination.

Lamination Cycle:

- 1) Pre-vacuum for 30 minutes
- 2) Control the heat rise to 4.5°C - 6.5°C (8°F - 12°F) per minute between 100°C and 150°C (210°F and 300°F).

Vacuum lamination is preferred. Start point vacuum lamination pressures are shown in the table below:

Panel Size		Pressure	
in.	mm	psi	kg/cm <sup>2</sup>
12 x 18	305 x 457	300	21
16 x 18	406 x 457	350	25
18 x 24	457 x 610	400	27

- 3) Set cure temperature at 218°C (425°F).
- 4) Cure time at temperature = 3.0 hours
- 5) Cool down under pressure at ≤ 6°C/min (10°F/min)

Drill at 350 - 400 SFM. Undercut bits are recommended for vias 0.023" (0.9cm) and smaller

De-smear using alkaline permanganate or plasma with settings appropriate for polyimide; plasma is preferred for positive etchback

Conventional plating processes are compatible with 85NT

Standard profiling parameters may be used; chip breaker style router bits are not recommended Bake for 1 - 2 hours at 250°F (121°C) prior to solder to reflow of HASL
